Microplastic extraction protocol

Microplastics were extracted from the gastrointestinal tract of fish and from the whole soft tissue of invertebrates. The protocol was previously tested and validated and all EPHEMARE project partners involved in fieldwork were subject to a training course on EPHEMARE protocols

For this part of the research, marine organisms were collected from several sites in order to evaluate if different location and environmental conditions can influence the presence of MPs in the biota.

IMPACT 2017 International Microplastics Photo Contest

North East

Atlantic

site

EPHEMARE invited submissions to IMPACT 2017 to express participant views on microplastics through the medium of photography. The competition not

only raised awareness but supported active engagement and learning about the subject area through the completion of the contest and subsequent

exhibition of entries. The international entries were judged by a jury of microplastic experts and through a public vote via the project's social media outlets. Pictured are 1st (Filipa Bessa), 2nd (Catia Goncalves), and 3rd (Adam Porter) place winners respectively. See the EPHEMARE Facebook page to view the range of fantastic submissions.

Ocean Plastics Lab

EPHEMARE recently contributed to the Ocean Plastics Lab, with entries from the IMPACT 2017 photo competition. The Ocean Plastics Lab is an international travelling exhibition showcasing the contribution of science to understand and combat the problem of plastics in the ocean. The exhibition opened on the 27th of September in Turin, Italy coinciding with the G7 science meeting and World Maritime Day and is moving to Paris in November 2017.

EPHEMARE scientists joined the 'Race for Water' (R4W) Odyssey 2017-2021, harvesting, sampling and analysing microplastics in Bermudan waters in July and in the waters around Guadeloupe in October this year. The Race for Water Foundation is on a voyage from Lorient to Dubai. Their ship allows researchers to conduct scientific studies in optimal conditions with minimal impact on the environment.

EPHEMARE scientists took part in the 'Less Plastic more Mediterranean' mission with Greenpeace. On board the Rainbow Warrior 3, activities included sampling organisms and seawater along the Mediterranean.
